

1. CV sent needs to be sent somewhere, with a notification in my inbox on Jobsage confirming that it has been sent and to whom to be able to follow up later if i want.
2. The AI assistant is critical. It must be available whenever needed. It can initially appear as a floating chatbot, but it must also be fully integrated when applying on a company website. When applying, the AI should use all candidate profile data and instantly provide or populate answers when the cursor is placed in any field, similar to how it generates a cover letter when a CV is uploaded. It should pre-fill responses, but the candidate must review before submission, with a disclaimer stating this.
3. All documents uploaded must be accurately parsed by the AI before applications. The AI must correctly interpret qualifications and not misrepresent the candidate (e.g., not identifying someone as a medical doctor if they hold a PhD in education).
4. A “Check Vacancies” button should be created at the top of sponsor licence companies. This will act as a refresher to ensure all vacancies are sourced and up to date. When clicked, it should display all vacancies across companies within the selected sector. So each company needs to have the number of vacancies next tot it and the top needs to have the total number.
5. Each company should also have a “Check Fitting Vacancies” or “Check Best Fit” button directly next to it. Probably the second name. This should display vacancies ranked from 100% to 0% fit, showing the percentage match based on how well the parsed CV and documents align with the job description.
6. The “Send CV” function must operate similarly to “Apply with Jobsage.” It should generate an AI-created cover letter and send the application directly to the company’s email address. This email shall come from the jobsage email created not candidate personal email.
7. Candidates must be able to apply directly on company websites. A cookie should track this action and send a confirmation to the Jobsage inbox, ensuring it appears under tracked applications. Any replies from employers must also be routed to Jobsage.
8. Sponsor licence companies must display their email addresses and phone numbers and addresses and websites.
9. Each candidate must have a Jobsage email upon account creation, and all communication with employers must be routed through Jobsage rather than personal email accounts.
10. Applications, whether submitted via company websites or sent speculatively, must appear under “Tracked Applications,” clearly categorised (e.g., applied via company website or speculative CV sent).

11. CVs shared with companies must not display the candidate's personal email address or phone number. These should be masked and replaced with the Jobsage email.
12. Interview invitations received in the Jobsage inbox must be tracked via cookies. The system should update tracked applications to reflect interview requests, display this as a metric on the dashboard, and automatically update when interviews occur.
13. Under "Job Opportunities," there should be no eligibility filter. Instead, all vacancies should be listed from 100% to 0% fit. The focus should be on vacancies, with company details (name, email, phone number, website) included within each listing.
14. On the sponsor licence page, all companies must display a website, phone number, email, and address.
15. The platform must guide candidates by recommending which jobs to apply for first (e.g., top 5 most fitting roles, then the next 5). This requires accurate parsing and matching of CVs and documents against job descriptions.
16. Eligibility should be a separate feature focused on regulatory and visa requirements (e.g., doctors need PLAB, nurses need OSCE, teachers need QTS or PGCE, associate professors need PhD and Advance HE Fellowship). It should be based on official government guidance and also account for visa status (in-country vs. relocation).
17. The user journey must be more concise and visually engaging, ending with a strong goal representation (e.g., a trophy or a candidate in a dream office) to reinforce motivation.
18. Progression between steps must be clear and actionable. For example, after completing a profile, the candidate should be able to click directly into "Verification" from the dashboard. Steps should be clearly numbered (Step 1, Step 2, etc.), with the final stage representing the "Dream Job that Moves You," supported by visual progress indicators. The steps can be represented as islands where visually the candidate is getting closer to their dream job: the goal.
19. All sections of the platform must remain fully synchronised. If a candidate applies for a role, it must reflect across the dashboard, opportunities, and tracked applications.
20. CVs must be consistently managed and aligned across all features.
21. If the candidate has a diversity of expertise and must apply to different places with different CVs, this shall be clearly shown. What is applied to what.
22. The enhanced CV generated for each job the candidate wish to apply for if they are more than one must be very professional and follow the UK standards. Now, it does not look like a CV. It must include email of JobSage too.

23. AI on Jobsage must be able to advise the candidate what can be done next based on the results of their applications. Chat GPT can do that so we can do it here too with the AI here having much better constant knowledge of the candidate.
24. The platform shall be clear it is not only to find a job but it is also to develop the career. So after they find a job and move, they will stay to keep their profile growing and they can have all their career growth on it. They can share it on linked in. It will save them the hassle of collecting profiles and documents every time they need to progress their career.
